

Lab 02 - Prompt context window to PowerPoint executive story

TGS-2024044051 | v1.0 | 27 September 2026

Scenario

Northstar Service is a synthetic service organisation. All records and metrics in this lab are fictional. Use an approved training tenant if available; otherwise complete the same evidence analysis offline.

Materials

- scenario.csv: 5 synthetic case records with task volumes, timing, claims and access values.
- roles.csv: pilot roles, licences and approved data access.
- pilot-metrics.csv: synthetic active seats, wage and license assumptions, and latency timings.
- ui-reference.png: authentic Tertiary Infotech training-tenant UI example; your tenant may differ.
- source-pack.md: synthetic policy excerpts, an outdated source and an injection test.
- evidence-template.md: learner evidence form.
- Microsoft 365 Copilot or Copilot Studio only when your trainer has provided access.

Procedure

1. Prompt context window. Open the matching row in scenario.csv, then check its role against roles.csv and source against source-pack.md. Record the source version and owner. Separate task, context, constraints and format. Calculate net minutes saved as baseline minus pilot minus review, and verify supported claims do not exceed total claims. Save the output as 01-prompt-context-window.md. Check: Never paste personal data into unmanaged chat. Negative test: Answer omits policy exception. Measure: Grounded claims divided by claims.
2. Grounded retrieval. Open the matching row in scenario.csv, then check its role against roles.csv and source against source-pack.md. Record the source version and owner. Retrieve accessible passages before generation. Calculate net minutes saved as baseline minus pilot minus review, and verify supported claims do not exceed total claims. Save the output as 02-grounded-retrieval.md. Check: Verify source version and user permission. Negative test: Citation points to superseded policy. Measure: Supported answer statements divided by total.
3. Word proposal draft. Open the matching row in scenario.csv, then check its role against roles.csv and source against source-pack.md. Record the source version and owner. Generate structure then compare to source register. Calculate net minutes saved as baseline minus pilot minus review, and verify supported claims do not exceed total claims. Save the output as 03-word-proposal-draft.md. Check: Human owns final facts and approval. Negative test: Unsupported cost claim enters draft. Measure: Verified claims divided by total claims.
4. Excel service analysis. Open the matching row in scenario.csv, then check its role against roles.csv and source against source-pack.md. Record the source version and owner. Aggregate cycle time by issue category. Calculate net minutes saved as baseline minus pilot minus review, and verify supported claims do not exceed total claims. Save the output as 04-excel-service-analysis.md. Check: Check formula range and outliers. Negative test: Blank dates skew mean. Measure: Median cycle time by category.
5. PowerPoint executive story. Open the matching row in scenario.csv, then check its role against roles.csv and source against source-pack.md. Record the source version and owner. Create a three-message decision deck. Calculate net minutes saved as baseline minus pilot minus review, and verify supported claims do not exceed total claims. Save the output as 05-powerpoint-executive-story.md. Check: Presenter validates every number. Negative test: Chart title and source mismatch. Measure: Correct figures divided by checked figures.

Copy-ready Copilot prompt

You are supporting a synthetic Northstar Service training case. Use only the provided scenario row. Identify your sources and assumptions. Complete the requested transformation, then list every claim that requires human verification. Never send, publish, grant access, or change production data.

Acceptance

- Five output artifacts correspond to the five rows in scenario.csv.
- Recompute net_minutes_saved independently from the three timing columns; record the source version used.
- For ROI use the role's hourly value and license cost from pilot-metrics.csv as labelled synthetic assumptions.
- For latency, add retrieval, model and tool component times for the same percentile; do not mix p50 with p95.
- Record whether the role may open the source; do not use the injected or retired source as an instruction.
- Every artifact records source, method, reviewer, date and a pass/fail decision.
- At least one failed or uncertain test is recorded with a correction.
- No real customer or tenant data appears in submitted evidence.

Troubleshooting

If the Microsoft feature is unavailable, state the licence/policy limitation and use the synthetic row to complete the same decision and validation evidence. Do not fabricate a live configuration.

UI reference

[!!!llustrative Microsoft workflow from a separate synthetic training tenant](#) This screenshot orients you to a Microsoft workspace. It is not evidence of your own configuration; submit your own screenshot or clearly labelled offline artifact.
